Mareks Lēperis

We came up with an idea that could fix the lack of motivation while learning in school. Students often feel like what they're learning is useless and won't be necessary in the future, but our website prototype that has a built-in AI, can help with that. "Pielieto!" is a website that shows where the skills that you learn in school can be useful in real life. After searching, for example, "calculating percentage", the trained AI bot answers with a few examples where this can be useful in real life, professions that require this skill and a test with a few questions (easy, medium, hard) surrounding this topic. As a bonus, it has an integrated Google Maps that shows job vacancies based on the topic searched.
