

Revisory

The problem: Many students struggle to remember what they learned in the previous lesson. Due to the fact that new lessons build upon earlier material, forgetting past content makes it difficult to grasp new topics. As a result a student may fall behind, leading to confusion and reduced engagement, as a result their grade decreases. Teachers don't have the time to remind or "re-cap" what they did in the previous lesson, because if they did so, learned topics in a year would decrease leading to bad exam results. And websites such as [Uzdevumi.lv](https://uzdevumi.lv) help, but in a way they are too complex, such as you needing to find the previous topic you studied for, reading tons of theory and doing some tasks. This is time consuming and for many students it seems too many steps.

The solution: An app that connects to E-klase to gather students' data from previous/upcoming lessons to help remind them what they did in previous lessons. The app would gamify the study process to be more appealing and each reminder would take up to 3-5 minutes for one subject.
