

SIGMA LAB

YOUR VIRTUAL LABORATORY

SigmaLab is a software that redefines the way we interact with **laboratories**, allowing users to access **hyperrealistic** virtual laboratories to perform **experiments** in physics, chemistry, and genetics fields.

**How can we reduce distances
between researchers or
students?**

**How can we make laboratories
accessible for everyone?**

**How can we make learning
laboratory activities safer?**

Your solution is SigmaLab!

- Our software allows scientists from all over the **world** to work **simultaneously** in a **virtual place**;
- It enables access for **everyone**, especially those unable to attend in **person**, while also **reducing** unnecessary **travel** and **CO₂ emissions**;
- It allows students to be able to use laboratories in an **easy way**, to expand their **knowledge**.

How can we do it?

Imagine a real lab equipped with specialized **cameras** linked to our software.

These cameras would capture **real-time actions** of students and teachers in the physical lab and project them into the SigmaLab software.

Thanks to this work in **collaboration** with schools that are willing to participate, we'll be able to **collect** all the datas that we need, making your experience as **detailed** as possible.

SigmaLab is a **bridge** between physical and digital worlds of science. It allows **hybrid participation** and for an even greater immersion, users can utilise **3D headsets** to feel as if they're standing right there in the lab.
