

Systemel[®]

SDMS

SDMS

A School Database Management System (SDMS) is a software application that serves as a central database for storing and managing information related to a school's operations. It consists of three main applications: an admin application, a teacher application, and a student application.

Systemel

Admin

Admin Application:

This is used by the school administrators to manage the overall system. They can add, update, or delete records of students, teachers, courses, and other resources. They can also generate reports and analyze data to make informed decisions about the school's operations.

Systemel

Teacher

Teacher Application:

This is used by the teachers to manage their classes. They can view their class schedules, student lists, and grades. They can also upload assignments, mark attendance, and input grades for their students.

Systemel

Student

Student Application:

This is used by the students to access their personal information, class schedules, assignments, grades, and other resources. They can also submit assignments and interact with their teachers through this application.
