Introduction

This report documents the process required to integrate internal training videos into Chamilo using a combination of Vimeo and Cloudflare.

This solution provides enhanced security and access control without significant additional costs and without the need to modify the platform's code.

Challenge Description

- -**Challenge:** For information security reasons, it is necessary that the internal training videos be made available directly on Chamilo, avoiding the use of YouTube.
- **-Problem**: Chamilo has disk space limitations for content storage. Uploading all internal videos directly to the platform would result in significant additional costs, as it would require purchasing more disk space.
- **Proposed Solution**: Use **Vimeo** in combination with **Cloudflare** to host the videos and embed them in Chamilo courses through the embed code, without the need for significant changes to the platform's code.

Objectives

Use the combination of Vimeo and Cloudflare to embed videos securely in Chamilo with granular access control, as described:

Vimeo Configuration: Set the videos to "Only people with the link" and, if available in the plan, configure a custom domain for strict access control.

– Cloudflare Configuration:

- o Configure the WAF to restrict access, allowing only the Chamilo server.
- o Geo-blocking (Optional): Limit access from specific regions as needed.
- IP Allow List: Allow access only from trusted IPs associated with the Chamilo server.
- Implement CORS rules to allow secure requests from Chamilo and restrict external sharing.

Comparison of Solutions: Loom, Vimeo, and YouTube

Loom:

- -Advantages: Ease of use and basic privacy configuration.
- **Limitations:** The free plan allows only 25 videos; for higher capacity, additional costs become a concern.

Vimeo:

- **Advantages**: Advanced privacy settings and support for a custom domain, providing refined control over video access.
- **Limitations**: Additional cost depending on the resources used and storage required.

YouTube:

- **Advantages:** Free alternative that allows uploads with an "Unlisted" setting, making videos accessible only with the link.
- Limitations: Lower privacy control; the link can be shared, compromising exclusive access.

Procedure for Embedding Vimeo Videos in Chamilo with Cloudflare

Step 1: Preparing the Video on Vimeo:

- Log in to Vimeo with the institutional account.
- Upload or record the training video.
- Set privacy to "Only people with the link" and, if available, configure a custom domain.
 - Obtain the embed code.

Step 2: Configuring Cloudflare:

- Set up the WAF to allow access only from the Chamilo server.
- Optionally, configure Geo-blocking to limit geographical access.
- Create an IP Allow List to include the IPs of the Chamilo servers.
- Properly configure CORS headers to allow Chamilo to make requests to Vimeo, preventing external access.

Step 3: Embedding in Chamilo:

- Log in to Chamilo with trainer/admin credentials.
- Select the desired course, create or edit a document.
- In the text editor, switch to HTML mode and paste the Vimeo embed code.
- Save and preview the document to confirm that the video is displayed correctly.

Benefits of the Solution (Vimeo + Cloudflare):

- **Robust Security:** Granular access control through WAF, CORS configuration, and Vimeo privacy settings.
- **Space Savings:** Videos are hosted outside the Chamilo server, avoiding additional storage costs.
- Flexibility and Performance: Cloudflare can enhance video delivery performance.
- Future Compatibility: The solution does not interfere with Chamilo updates, allowing continued use without code adjustments.

Considerations and Costs

- Additional Costs: The use of Vimeo and Cloudflare may incur extra costs depending on the number of videos and chosen security settings. Evaluating these costs is important for future decisions.
- **Maintenance:** Cloudflare configuration may require adjustments over time, especially with updates to server IPs or new Chamilo features.

Conclusion

The proposed solution with Vimeo and Cloudflare provides the necessary security and control to keep videos restricted to Chamilo, efficiently meeting security and cost-effectiveness requirements. This combination allows the organization to continue offering training securely and efficiently, without compromising data integrity or incurring high storage costs on Chamilo.
